

# Isomorphic - React.js Next.js Admin Dashboard

---

This monorepo is powered by [Turborepo](#), a tool that optimizes build times for monorepo projects. Turborepo leverages your existing package.json scripts and dependencies, making it easy to set up and use.

## Getting Started

System Requirements:

- [Node.js 20.16.0](#) or later.
- [Turborepo 2.1.1](#)
- [pnpm - package manager 9.9.0](#) (recommended). We used this version. But you can change it as you want. Learn more about [Turborepo packageManager](#)

**Turborepo:** For quick install just run the following command it will install turbo in your system globally.

```
npm install -g turbo
```

## Starting development server

**Setup environment variables in every workspace .env file. You can find the .env.example file in the root of every workspace.**

To start the development server locally run the following commands

```
pnpm install  
  
pnpm run dev
```

To build locally and view the local build run the following commands.

```
pnpm run build  
  
pnpm run start
```

**You can find more commands in the project root package.json file.** To learn more about these commands checkout our [Documentation](#)

In your monorepo's root directory, there is a [turbo.json](#) file. This file allows you to configure custom tasks, set global dependencies, set environment variables, and more. [Learn More about Turborepo](#)

Happy coding! 🚀
